

PORTFOLIO HEALTH MAP TAB

VP PRODUCT MANAGEMENT EXECUTIVE GUIDE

Generated: June 2026 • Document Version: 1.0

Executive Purpose: The **Portfolio Health Map** tab is the nerve center of the Product Lifecycle and Portfolio Intelligence application. It is designed specifically for the **VP Product Management** to monitor, analyze, and manage the health, complexity, and margin performance of the active 100-SKU portfolio.

By consolidating commercial metrics (revenue, growth) with supply chain complexity markers (lead times, supplier fragmentation, stockouts), it provides a single "pane of glass" that translates transactional data into actionable portfolio decisions (such as new investment scaling, pricing updates, and long-tail SKU sunsetting).

WHY IS THIS TAB CRITICAL FOR THE VP?

Without this tab, the VP Product Management lacks visibility into how SKU count expansion drives operational complexity and eats away margins. Traditional reports separate sales performance from supply chain pain points. This tab unites them, allowing the VP to:

- Identify and resolve bottlenecks (such as stockouts or single-supplier vulnerabilities) that threaten revenue.
- Approve or defer high-value decisions (CAPEX facilities, NPD launches, and sunsetting campaigns) from a centralized desk.
- Model rationalization scenarios that balance complexity reduction (freeing safety stock capital) against revenue tail risk.

FEATURE-BY-FEATURE EXECUTIVE BREAKDOWN

1. PORTFOLIO HEALTH SCORE GAUGE

STRATEGIC KPI

WHY DO WE NEED IT?

It provides an instant diagnostic index (0-100%) of the active portfolio. The algorithm weighs gross margin compliance, complexity penalties (PCI), stockout frequencies, and positive lifecycle distribution.

EXECUTIVE UTILITY FOR THE VP:

Acts as the VP's high-level dashboard temperature check. If the score drops into "Critical Drag" (<70%), it signals that tail SKUs are diluting margins and overloading the supply chain. If it remains "Optimal" (≥85%), the portfolio holds a healthy balance of cash cows and growth products.

2. PRODUCT LIFECYCLE JOURNEY TIMELINE

LIFECYCLE MANAGEMENT

WHY DO WE NEED IT?

Replaces passive distribution lists with a horizontal left-to-right journey timeline mapping the 100 SKUs into four distinct stages: *Introduction*, *Growth*, *Margin*, and *Decline*. It displays dynamic SKU counts, absolute revenues, and a visual up/down efficiency arrow comparing Revenue Share % vs. SKU Share %.

Introduction (Purple)

Growth (Teal)

Margin (Amber)

Decline (Red)

EXECUTIVE UTILITY FOR THE VP:

Ensures the VP can track commercial efficiency. The green/red arrows immediately identify underperforming lifecycle areas: for example, if the *Decline* stage holds 23% SKU share but only contributes 13% revenue (red arrow), it represents an inefficient drain on resources. The hover popovers allow drilling down into specific SKU details instantly.

3. EXECUTIVE ACTION DESK

GOVERNANCE & WORKFLOW

WHY DO WE NEED IT?

Centralizes three essential operational components:

- **Executive Approval Board:** Workflow queue for capital expenditure, budget approvals (e.g. Mango Fizz launch budgets), or rationalization sign-offs.
- **Portfolio Health Alerts:** Flagging immediate operational risks (stockout events, promo dependency, margin compression).
- **Decisions Pending Card:** Direct triggers for AI-suggested actions, such as scaling successful products or approving sunset recommendations.

EXECUTIVE UTILITY FOR THE VP:

Reduces administrative latency. The VP can approve CAPEX or trigger SKU sunseting directly from this desk, with the system immediately updating downstream datasets and sending automated notifications to category managers.

4. INVESTMENT VS. RETURN QUADRANT MAP

CAPITAL ALLOCATION

WHY DO WE NEED IT?

A scatter chart mapping all SKUs across growth rate (Y-axis) and gross margin (X-axis). It segments products into four capital allocation categories:

Quadrant	Characteristics	Recommended Action
Quick Wins	High Margin / High Growth	Scale / Protect: High-priority capital allocation
Strategic	High Growth / Lower Margin	Invest: Focus on cost optimization to improve margins
Niche	High Margin / Low Growth	Harvest: Cash cows, protect pricing
Avoid	Low Margin / Low Growth	Rationalize: Prime candidates for sunseting

EXECUTIVE UTILITY FOR THE VP:

Identifies capital reallocation opportunities. The VP can filter by region and see exactly which SKUs are in the "Avoid" quadrant, helping justify R&D cuts or margin adjustment mandates to regional directors.

5. PARETO SKU CONCENTRATION SIMULATOR

SCENARIO MODELING

WHY DO WE NEED IT?

Models the classic 80/20 rule in portfolio management. In the default F&B active dataset, the top 30% of SKUs generate 62.88% of revenue. The slider lets the VP simulate rationalizing (cutting) the bottom tail from 20% to 60%.

EXECUTIVE UTILITY FOR THE VP:

Enables low-risk modeling of complexity reduction. The VP can slide to 35% and instantly see:

- **Safety Stock Freed:** Hard capital savings (e.g. freeing \$104M in working capital).
- **Revenue Tail Risk:** The commercial sales impact of removing those SKUs (e.g. 27.08% revenue at risk).

This allows the VP to establish a balanced tail-cut threshold before executing a physical sunset campaign.
